

ISRC & UPC Codes

Essentially, the ISRC is a code that tracks your specific song. And the UPC is a barcode that tracks a specific product at the point of sale.

The **International Standard Recording Code (ISRC)** is an international identification system used in uniquely identifying sound recordings and music video recordings. Each code is a unique and permanent identifier for a specific sound recording, and is used in tracking your music by digital music stores, collection societies, and is increasingly becoming a tool in the fight against piracy. The ISRC system is the key to royalty collection for recordings in the digital information age.

The **Universal Product Code (UPC)** is a barcode that is widely used in the United States, Canada, United Kingdom, Australia, New Zealand, in European and other countries for tracking trade items in stores. The UPC is the barcode mainly used for scanning of trade items at the point of sale.

Obtaining ISRC and UPC Codes

When you release a single or an album, you need to get ISRC's and UPC's assigned to them. If it's a single, you'll need one ISRC and one UPC. If it's an album, you'll need an ISRC per song, and one UPC for the entire package/album.

As an independent artist or manager, you're more likely going through a digital distribution platform such as TuneCore. If this is the case, then your ISRC and UPC codes are automatically generated for you as soon as you upload and complete your catalogue submission for release.

Record labels, on the other hand, create their own ISRC codes.
